INDUS / BRAHMI

Full proposed mapping atlas

714 catalogue codes • 21 grid pages • 17 October 2026

What “100%” means

The expanded Yajnadevam mapping assigns values to every sign in all 2,477 complete, single-line records with known horizontal direction in our filtered Tejesh Raut corpus. These are records, not deduplicated independent texts. Assignment does not establish a correct language, pronunciation or translation.

How to read each cell

Top: catalogue ID and raw proposed value. Left: Indus font drawing. Right: Brahmi character display of the raw value. Bottom: source canonical sign code(s), with “derived” where a blank field was filled by the author’s canonical rules. The chart includes all 714 non-placeholder assignments, even those outside the filtered subset.

Brahmi display convention

The right-hand symbols spell out raw labels as separate Brahmi character names. They are NOT fully orthographic Brahmi words. For example “as” is displayed as independent a plus base s, without claiming a vowel or consonant-cluster reading. Uppercase A means long ā. Aspirated/retroflex alternatives and sandhi are not restored; the original author groups several such sounds.

Image completeness

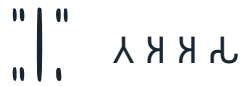

The supplied font contains 713 of the 714 mapped glyphs. Code 941 has a value but no font glyph; its cell explicitly says image unavailable. No missing ancient shape has been invented. Codes 000 and 999 are excluded damage/unknown placeholders.

Relation to your screenshot

This expands the full repository mapping, not only the 38 entries in Table 7. The screenshot’s historical claim that Indus developed into Brahmi is not established by this chart. Glyphs are modern reference drawings, not photographs of ancient objects.

METHOD & READING NOTES

Rajesh P. N. Rao et al., PNAS (2009)

The linked paper studies sequential structure with a Markov model. Its EBUDS dataset has 1,548 deduplicated lines and about 7,000 sign occurrences, using Mahadevan's 417-sign inventory. It models sign positions, neighbours and missing-sign prediction; it does not supply Brahmi sound values. The authors note limitations of pairwise models and the older corpus. Its sign numbers must not be equated directly with this chart's catalogue IDs.

What the paper contributes

Use positional and neighbouring-sign behaviour as constraints on proposed mappings. In particular, the paper observes that some visually similar signs behave differently. The 100% assignment result here is a different metric from missing-sign prediction or linguistic validation.

M-304: literal lookup only

Stored code: +090-740-220-742-534-550-090+. In the recorded R/L order, the raw assignment is a | as | as | an | m | an | a. No grammar, prayer or deity name is established by that lookup.

Reproducibility

Mapping source: yajnadevam/lipi commit fc8813a52e183d19c441631dc26c33a4dccbea39. Expanded with one ordered canonical pass matching mkregex in src/pages/index.vue. Font encoding is E000 + catalogue number. The previous audit package contains code, per-record results and snapshots. This atlas introduces no extra readings.
